

The invisible foundation of every connected home and business.

A dependable network supports smart-home control, music, television, CCTV, remote working and guest Wi-Fi. Riverside Audio Visual designs the system around the property rather than relying on a single domestic router.

Designed, supplied, installed and supported by Riverside Audio Visual.

Every project begins with a conversation, a room survey and a clear specification. We coordinate with homeowners, architects, interior designers, builders and electricians from first fix through commissioning.

A network designed for the whole property

A practical guide to the systems and decisions we can plan with you.

Survey and design	Property layout, construction materials, users, devices, outdoor areas and future requirements are assessed before equipment is selected.
Routers and switching	Business-grade routing, managed PoE switches, VLANs and secure remote management for stable performance.
Wi-Fi access points	Correctly positioned indoor and outdoor access points provide consistent coverage without relying on consumer extenders.
Smart-home priority	Automation, streaming, CCTV and critical devices can be separated and prioritised for reliability.
Guest and business networks	Separate networks can be created for family, staff, visitors, tenants, point-of-sale and building systems.
Installation and support	Structured cabling, rack design, commissioning, documentation, monitoring and ongoing support.

Ready to plan your project?

Send a floor plan and details of current Wi-Fi problems to sales@riversideav.co.uk or call 0208 159 4443 for a network survey.
